

### **FLUXUS G532CA**

## Non-invasive ultrasonic volumetric flow rate measurement of compressed air

#### **Features**

- · Non-invasive ultrasonic measurement of compressed air, technical and medical gases
- · Integrated standard volumetric flow rate calculation, temperature and pressure compensated via process inputs
- Bidirectional measurement with flow direction detection and separate totalizers
- · Drift- and maintenance-free, since there is no measurement impairment due to moisture, dirt or oil
- Perfectly suitable for leakage monitoring by detecting the smallest flow velocities from 0.03 ft/s
- Smart meter/loT ready via Ethernet interface with corresponding IP data protocols (e.g. Modbus TCP)
- Sophisticated support software for parameterization, remote control, recording and automatic state diagnosis (FluxDiagReader, FluxDiag, Advanced Meter Verification)

#### **Applications**

- Energy management and leakage monitoring in compressed air networks
- · Monitoring and consumption measurement of medical, pharmaceutical and technical clean gas
- Balancing and cost distribution
- · Process optimization

#### **Function**

#### Measurement principle

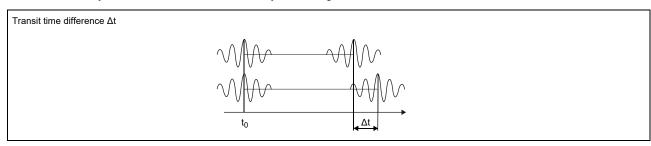

The transducers are mounted on the pipe which is completely filled with the fluid. The ultrasonic signals are emitted alternately by a transducer and received by the other. The physical quantities are determined from the transit times of the ultrasonic signals.

As the fluid where the ultrasound propagates is flowing, the transit time of the ultrasonic signal in flow direction is shorter than the one against the flow direction.

The transit time difference  $\Delta t$  is measured and allows the flowmeter to determine the average flow velocity along the propagation path of the ultrasonic signals. A flow profile correction is then performed in order to obtain the area averaged flow velocity, which is proportional to the volumetric flow rate.

The integrated microprocessors control the entire measuring cycle. The received ultrasonic signals are checked for measurement usability and evaluated for their reliability. Noise signals are eliminated.

#### Calculation of volumetric flow rate

$$\dot{V} = k_{Re} \cdot A \cdot k_a \cdot \frac{\Delta t}{2 \cdot t_{\gamma}}$$

where

V - volumetric flow rate

k<sub>Re</sub> - fluid mechanic calibration factor

A - cross-sectional pipe area
 k<sub>a</sub> - acoustic calibration factor

Δt - transit time difference

 ${\sf t}_{\sf V}$  - average of transit times in the fluid

#### Calculation of standard volumetric flow rate

The standard volumetric flow rate can be selected as physical quantity. It is calculated with the following formula:

$$\dot{V}_N = \dot{V} + \frac{p}{p_N} + \frac{T_N}{T} + \frac{1}{K}$$

where

V<sub>N</sub> - standard volumetric flow rate

operating volumetric flow rate

p<sub>N</sub> - standard pressure (absolute value)

p - operating pressure (absolute value)

T<sub>N</sub> - standard temperature in K

operating temperature in K

K compressibility coefficient of gas: ratio of the compressibility factors of the gas at operating conditions and at standard conditions  $Z/Z_N$ 

#### Number of sound paths

The number of sound paths is the number of transits of the ultrasonic signal through the fluid in the pipe. Depending on the number of sound paths, the following methods of installation exist:

#### · reflect arrangement

The number of sound paths is even. The transducers are mounted on the same side of the pipe. Correct positioning of the transducers is easy.

#### · diagonal arrangement

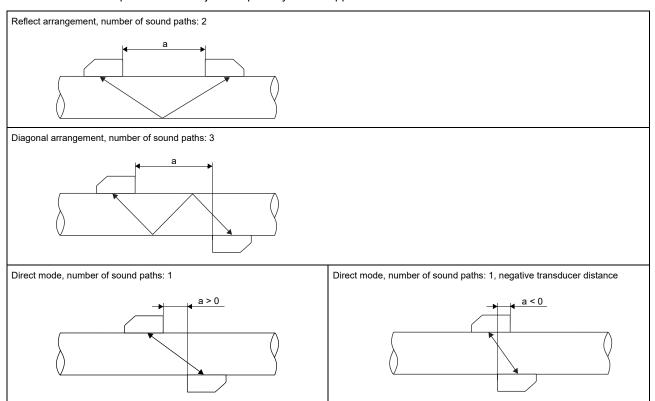

The number of sound paths is odd. The transducers are mounted on opposite sides of the pipe.

#### direct mode

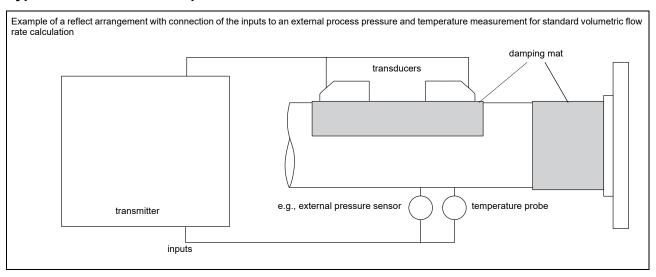

Diagonal arrangement with 1 sound path. This should be used in the case of a high signal attenuation by the fluid, pipe or coatings.

The preferred method of installation depends on the application. While increasing the number of sound paths increases the accuracy of the measurement, signal attenuation increases as well. The optimum number of sound paths for the parameters of the application will be determined automatically by the transmitter.

As the transducers can be mounted with the transducer mounting fixture in reflect arrangement or diagonal arrangement, the number of sound paths can be adjusted optimally for the application.

# **Coupling materials for transducers**

type	ambient temperature
	°F
coupling compound type N	-22 to +266
coupling pad type VT	14 to +392

### **Damping mats**

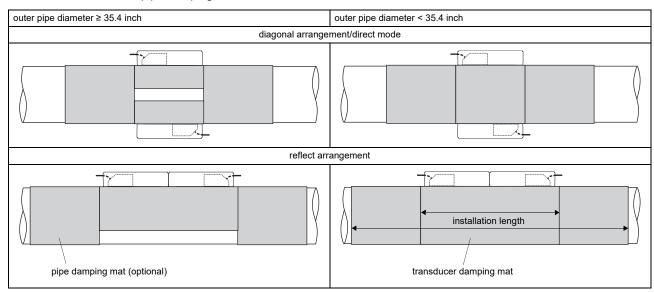

Damping mats will be used for the gas measurement to reduce acoustic noise influences on the measurement.

#### transducer damping mat

Transducer damping mats will be installed below the transducers.

#### pipe damping mat

Pipe damping mats will be installed if the sound propagation is disturbed at reflection points (e.g., flange, weld). Depending on the noise, the pipe damping mats will be installed at one or both sides of the transducer damping mat. If the local conditions are unknown, pipe damping mats should be installed.
